

EYE CLICK DONATION FOR ALS

Donate while experiencing what it's like to have Amyotrophic Lateral Sclerosis

Most patients with an advanced form of ALS can only control the movement of their head and eyes. So we created a website that allows people to donate for ALS research by doing just that: only using their head and eyes.

Using special eye and face tracking software, we register head movements and use these to move the mouse cursor; blinking your eyes allows you to make eye clicks. The site allows you to enter your name and donate using only your head and eyes.
